

Sponsler Company is now approved to supply PRECISION TURBINE FLOWMETERS and electronic instrumentation for sanitary applications. Our first application configuration was installed at Pleasant View Farms for loading Milk into tankers. The unique design of the turbine allows the end user to thoroughly clean the internals without removing them from the housing. All of the meter's wetted parts are highly polished and crevice free to prevent contamination.

**Application of the Month**

**“Sanitary Meters for Milk and Milk Products”**

*TYPICAL CONFIGURATION:*

**How it works:** Milk is metered from the storage tank into the tanker. The SP714 mounted on the meter generates pulses to the SP2850 for accurate measurement. Because temperature is a primary factor in mass flow with food applications, a temperature probe is installed in the downstream end of the meter run for constant monitoring.
